A Siemens Business

Cloud-based Automated SoC Design for an Intelligent Sensor

Tim Whitfield, VP Strategy for Automotive & IoT, Arm

Jeff DiCorpo, SVP Business Development, Efabless

Jeff Miller, Application Engineering Consultant, Mentor

#ArmDevSummit

Content

- Introduction
- Developing with SoC Design Template
- Design Implementation
- Where to Go Next

Open Innovation

Enabling 1 Trillion Connected Devices

Enabling anyone to build custom silicon

Open innovation leveraging the Arm ecosystem

Barriers to Custom SoC

Addressing those barriers will open a larger Custom SoC market

Inertia

- Standard chips "good enough"
- No simple solution

Knowledge gap

- Don't know it's an option
- "Space of the Possible" with Custom SoC
- Development process
- Cost NRE
- Potential unit cost
- How to source IP/tools

Capabilities gap

- Team
- Skill set
- Address book
- Ability to specify
- Ability to select the right partners

Cost

- High NRE cost
- IP licensing
- Development time

Perceived risk

- New venture out of "core competencies"
- Many unknowns
- Missing market window

Breaking Down the Barriers

Inertia

- Demonstrate capabilities
- Show success stories
- Abstract complexity

Knowledge gap

- Centralize information
- Show what can be included in SoCs
- Connect to partners that can bring knowledge in
- Bring transparency (cost, quality, user feedback)

Capabilities gap

- Easily connect to design partners
- Reference systems
- Bring elements of the supply chain in a single place

Cost

- No large upfront cost for infrastructure, IP or EDA
- Rapid design time/time to samples
- Shared knowledge and starting point

Perceived risk

- Trusted platform
- Reduce unknowns
- Predictable time to silicon samples
- Industry standard tools and IP

SoC Design Templates

SoC Design Templates

Foundation for Open Innovation

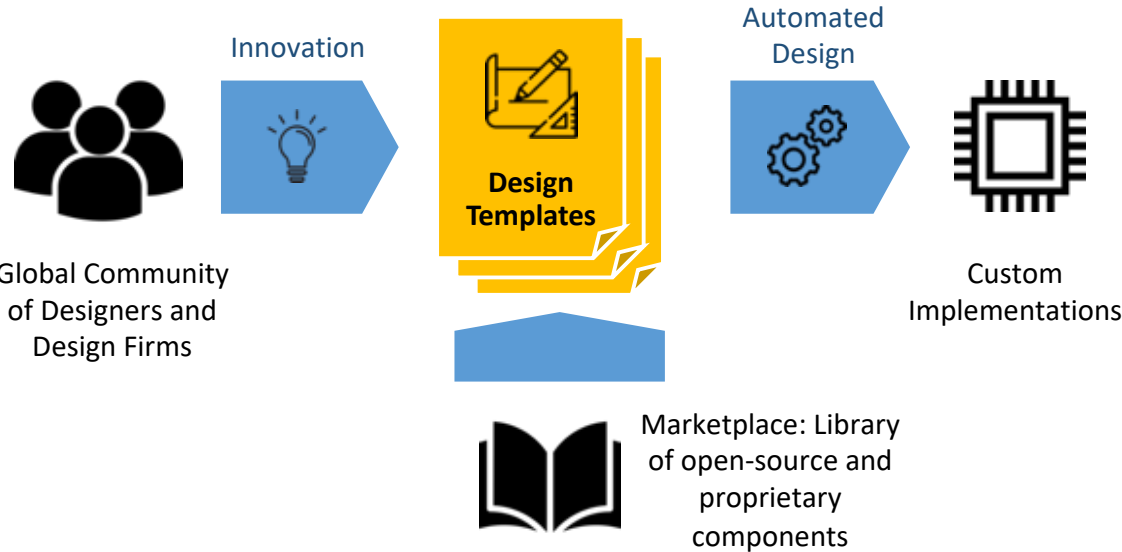

PROBLEM

Electronics are required for all products but are too complex, time consuming and expensive to create

SOLUTION

A New Development Model Based on Pre-Engineered Open Source Design Templates

Development Flow

1 Easy web-based drop-down menu configuration

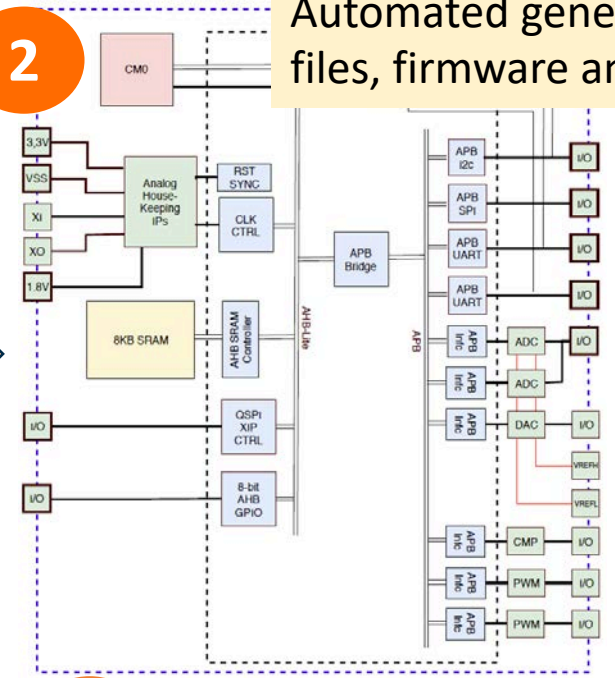

SLOT	PERIPHERAL	DESCRIPTION	STOP MODE	IRQ	
1	AHB QSPI Flash Interfac	AHB compatible QSPI peripheral to communicate with external SPI Flash Memory. It is designed...	Up	No IRQ	FIXED
Option		Value			
Boot Mode		External Flash			
2	GPIO port, 4-pin (AHB)	General purpose I/O for AHB Bus.	Up	No IRQ	X
3	GPIO port, 4-pin (AHB)	General purpose I/O for AHB Bus.	Up	No IRQ	X
4	SPI Master (AHB)	SPI master controller for AHB bus.	Up	No IRQ	X
5	UART (AHB)	UART interface controller for AHB bus.	Up	5	X

Add Up to 6 more AHB peripherals can be added

CONFIGURATION ESTIMATES
 Licensing Cost \$0.00 USD
 Part Cost Estimate \$1.26 USD
 Die Area (core constrained) 4.16 mm²
 Total I/Os 40
 CONFIGURATION VIOLATIONS (No Violations)

2 Automated generation of design files, firmware and testbenches

3 Streamlined implementation

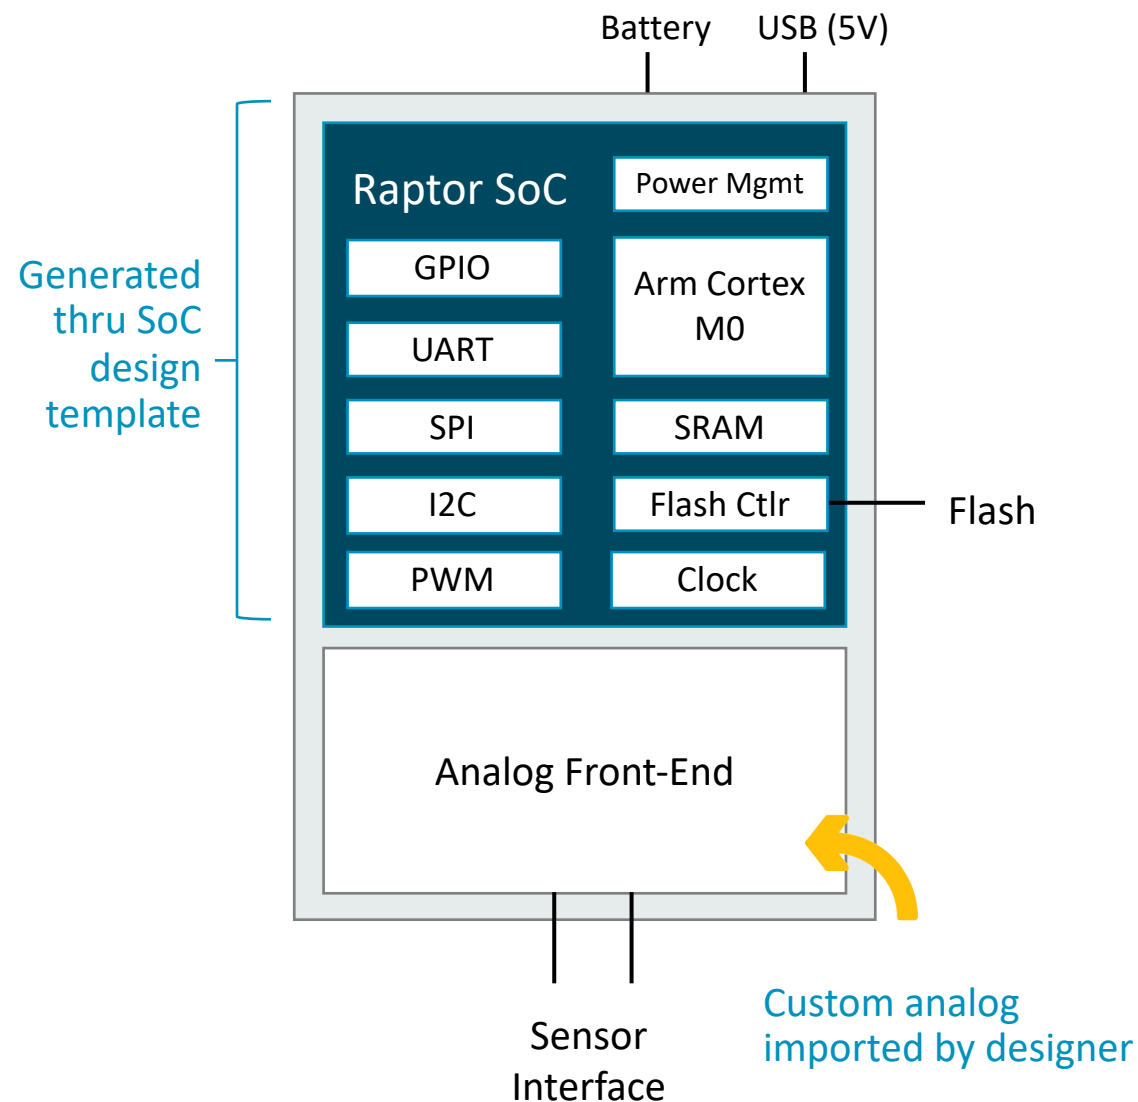

4 Fast and affordable delivery of silicon samples

ASIC for an Intelligent MEMS Sensor

Combines custom analog front-end with configurable SoC design template

- Leverage SoC design template for MCU-based ASIC controller
- Configuration optimized based on application requirements
- Leverages existing design for digital system design
- Integrated with user provided analog front-end
- Example front-end with digital bus wrapper provided

Configuring the SoC

ARMAHBL Peripherals

SLOT	PERIPHERAL	DESCRIPTION	STOP MODE	IRQ
1	AHB QSPI Flash Interfac	AHB compatible QSPI peripheral to communicate with external SPI Flash Memory. It is designed...	Up	No IRQ
Option		Value		
Boot Mode		External Flash		
2	GPIO port, 4-pin (AHB)	General purpose I/O for AHB Bus.	Up	No IRQ
3	GPIO port, 4-pin (AHB)	General purpose I/O for AHB Bus.	Up	No IRQ
4	SPI Master (AHB)	SPI master controller for AHB bus.	Up	No IRQ
5	UART (AHB)	UART interface controller for AHB bus.	Up	5

Add Up to 6 more AHB peripherals can be added

CONFIGURATION ESTIMATES

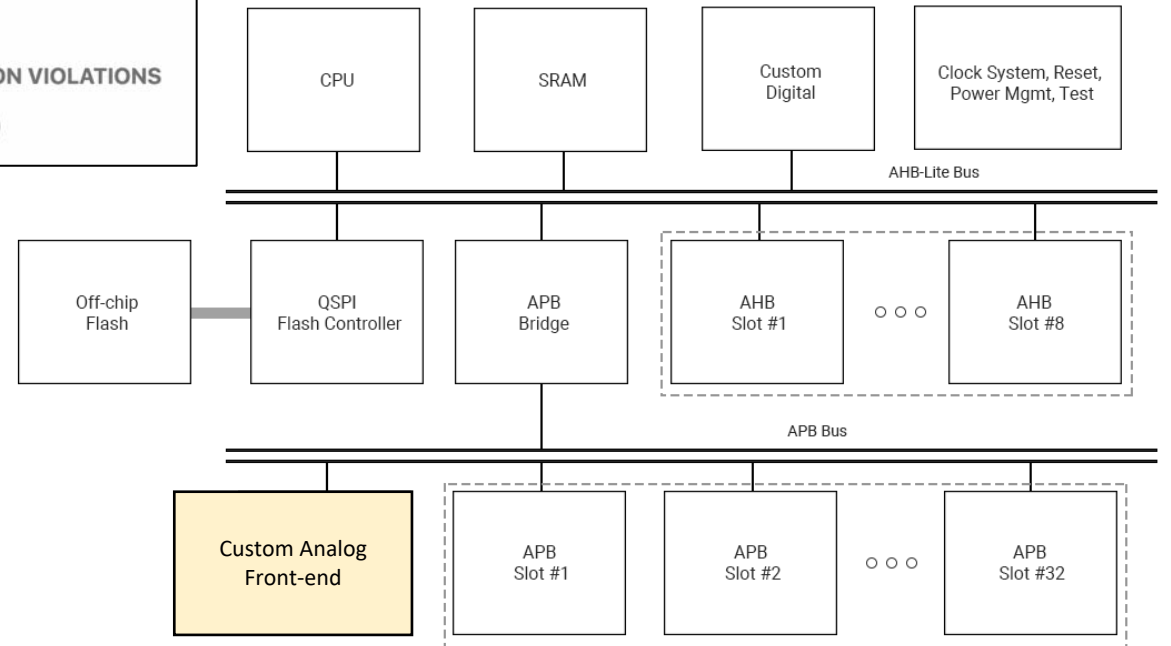

Licensing Cost
\$0.00 USD

Part Cost Estimate
\$1.27 USD

Die Area (core constrained)
4.21 mm²

Total I/Os
53

CONFIGURATION VIOLATIONS
(No Violations)

Saved SoC Configuration

Automated Design Generation

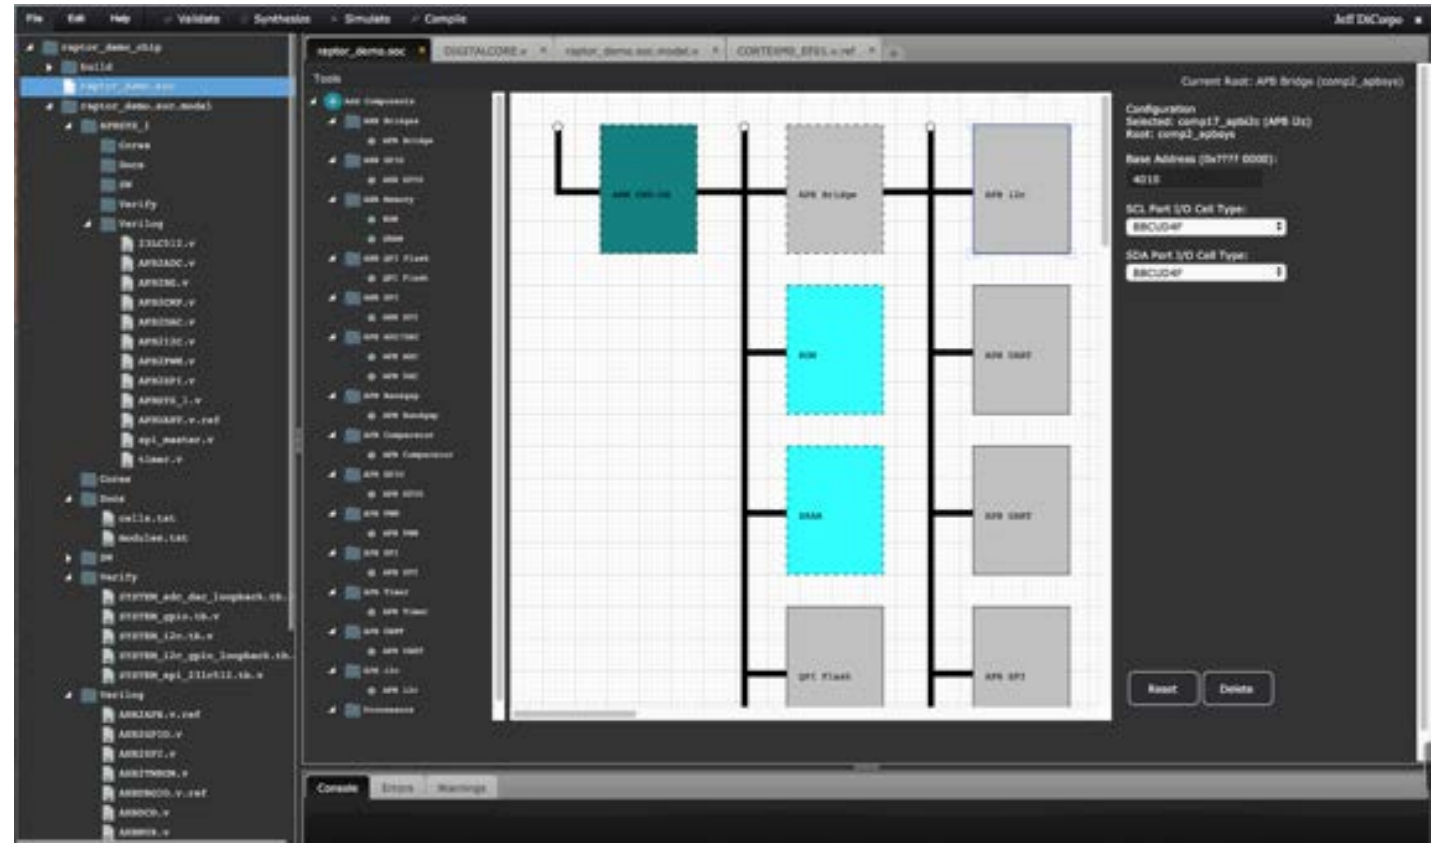

Configurations stored from web configurator

Tool automatically generates a top-level SoC model

Inspect and confirm configuration settings

SoC generator builds the set of design files:

- Top-level design
- Verilog source files
- Testbenches
- Firmware stub files

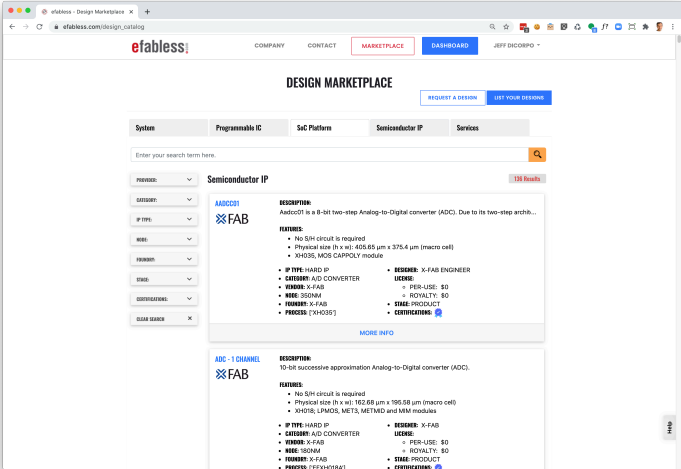

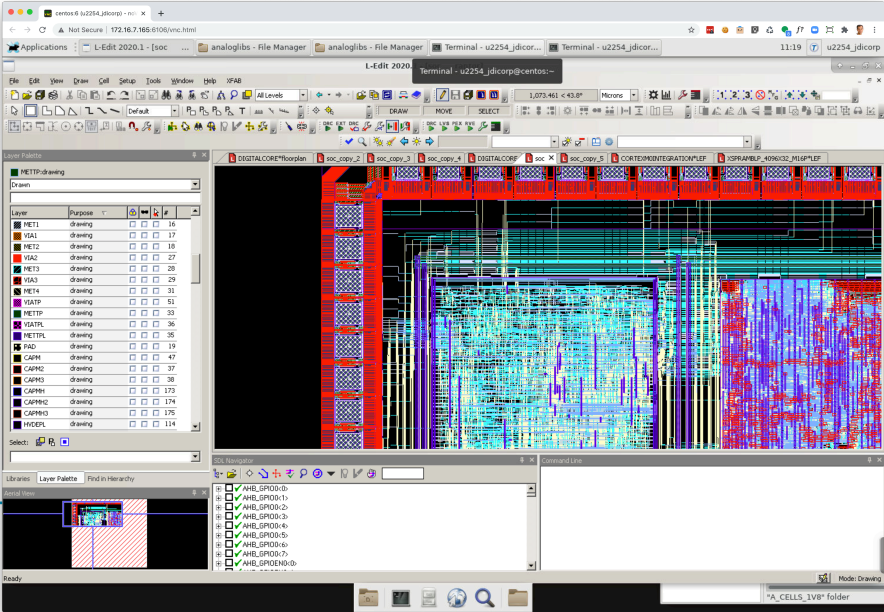

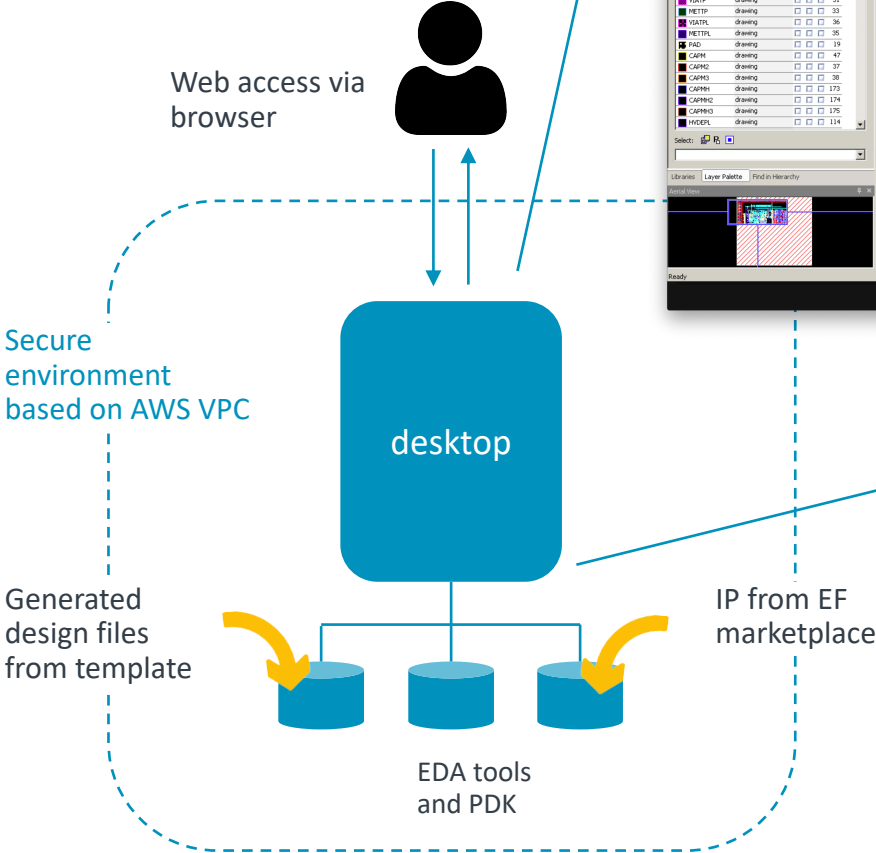

Tanner EDA Design Flow

Design files are exported to desktop with EDA design flow on the platform

- Preconfigured environment with foundry PDK
- All IP exists in the marketplace
- Design is generated to be implementation ready with the design flow

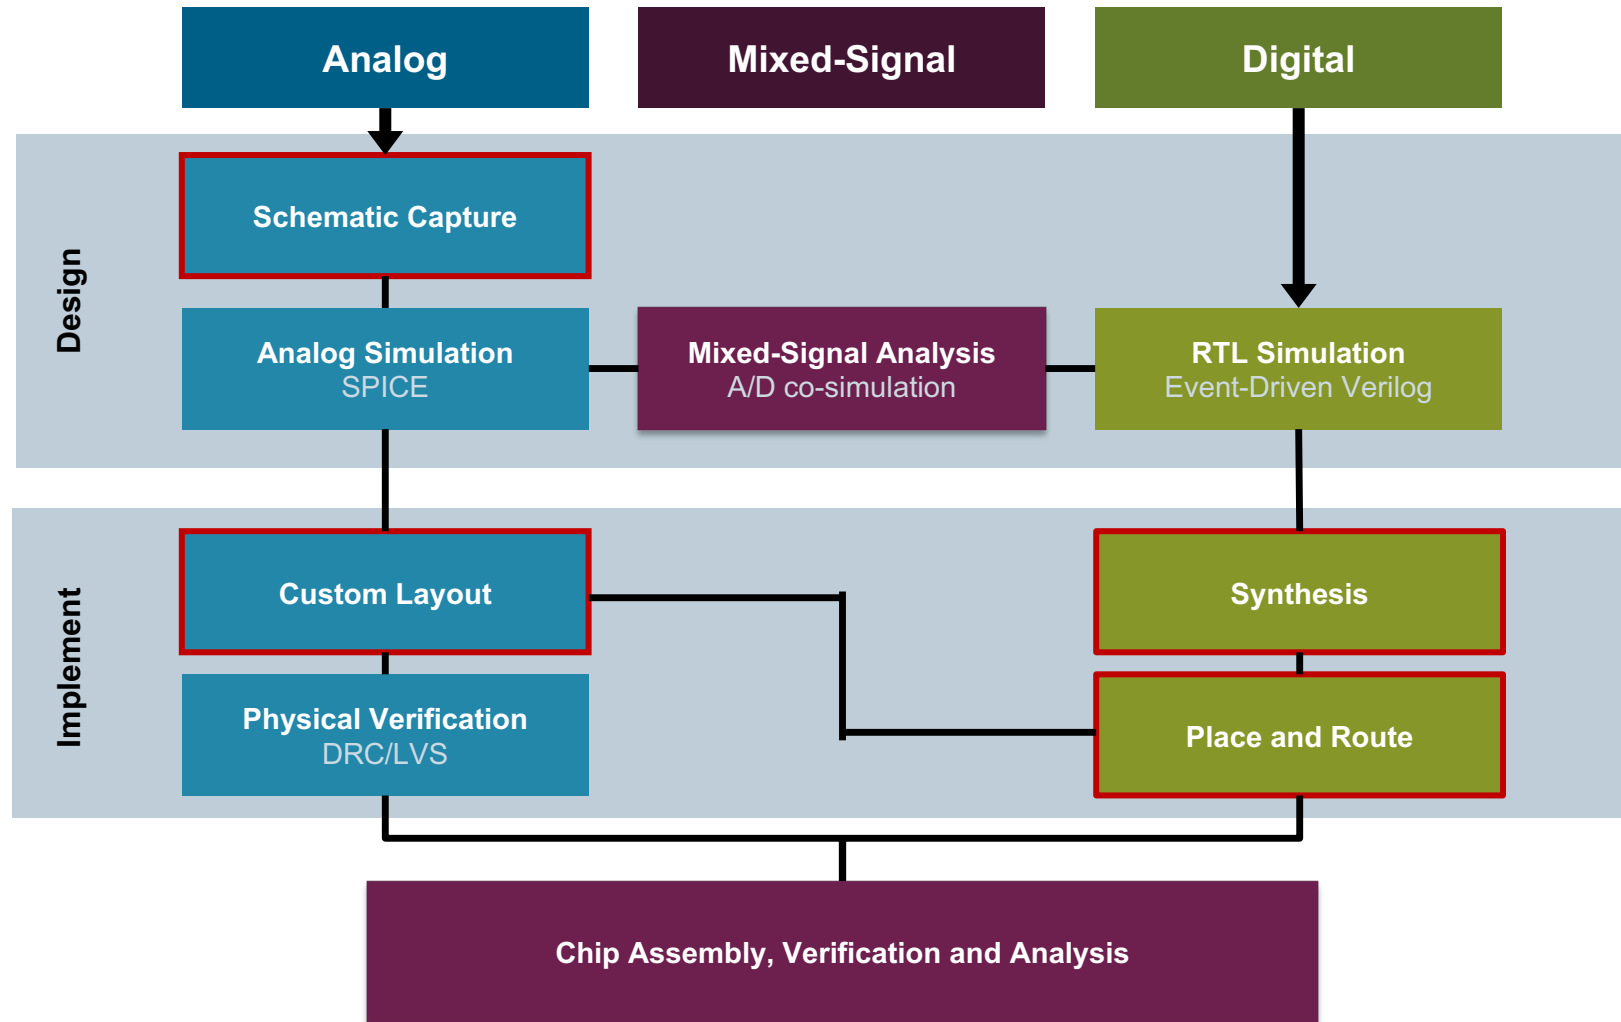

Multi-user access support

Utilize your existing licenses for Tanner EDA

Design Implementation

Typical Mixed Signal IC Implementation Flow

Full Custom Block Design

Active sensor requires custom analog driver and readout circuit

- Transmit pulse requires 12V drive circuit
 - Boosted from 3V control signal from μC
- Receive logic must detect 500 microvolt signal
 - RX detect signal amplified to 3V logic level and latched
- Circuit interfaces directly to APB bus
- Time of flight measured by μC using timer peripheral

Behavioral Modeling

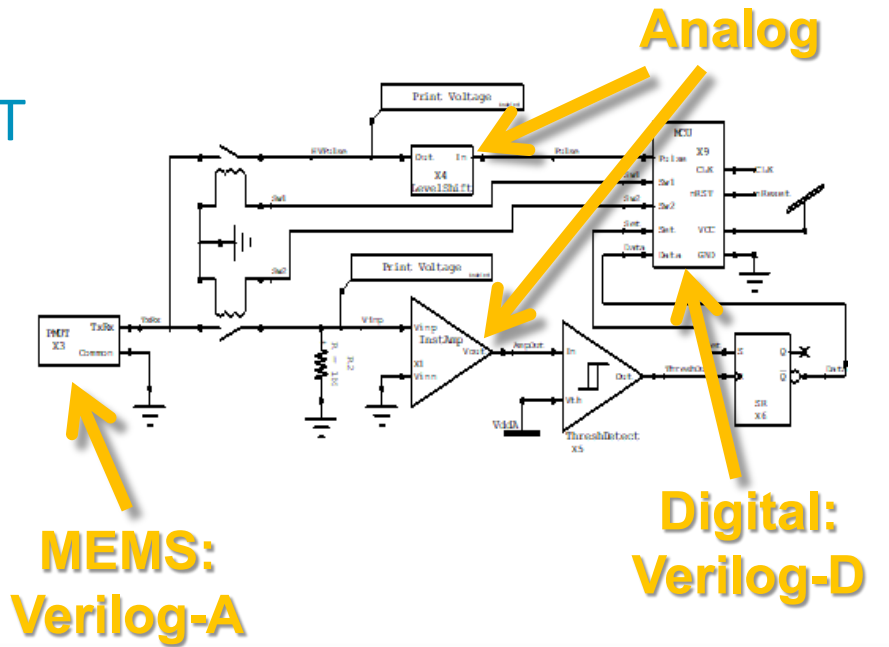

Top-down design with executable model of MEMS PMUT

Top-down model created using a combination of techniques

- Verilog-A reduced-order model for MEMS transducer
- Verilog-D model of APB interface
- Verilog-A models of analog components

Simulated in SPICE/Verilog co-simulator

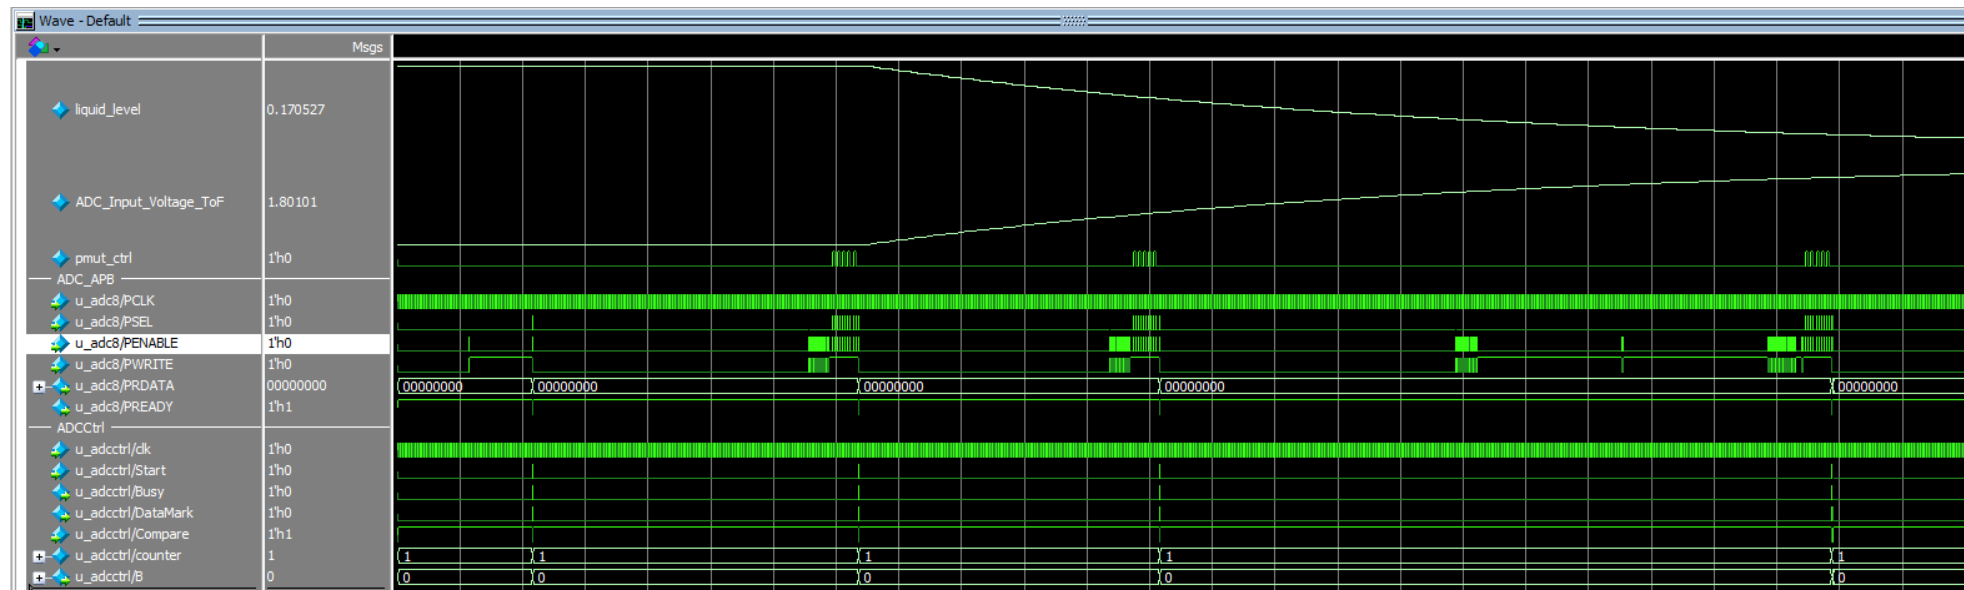

Once behavior is finalized, transistor-level design fills in analog blocks, swapping in for simulation

Top Level Simulation

Full chip simulation including RTL of major digital components

- Ensures necessary registers are exposed
- Have correct default values
- Power on and sleep/wake behavior
- System power estimation

Floorplan & Chip Assembly

Floorplan

Assemble & place hard macros

Create padframe

Determine shape available for digital logic

Optimally place ports on logic periphery for connections to padframes and macros

Perform top-level power and signal routing

Digital Implementation

Synthesis, Placement and Routing

In contrast with analog, digital implementation is highly automated

RTL code is synthesized into a gate level netlist

P&R goes through several phases to create the design layout

- Placement and optimization
- Clock tree synthesis
- Routing
- Finalization

Verification

Physical & Circuit Verification

Design Rule Checking – make sure all shapes are manufacturable using the selected process technology

Layout vs. Schematic – make sure the all the devices are correctly sized, gates are correctly placed, and wires are all correctly connected and not shorted

Electrical Rules Checking – make sure best practices are followed regarding ESD, latchup, metal migration, etc

Functional Verification

Static and dynamic timing checks of digital logic clocking

Functional equivalency checks between design representations (RTL vs gates vs post-P&R)

System level simulations using post-layout netlists

Simulation of interconnect parasitics and layout-dependent device effects, device noise, etc

Tape-Out

Final design is sent to manufacturing

Chip finishing tasks are done like metal density fill

Final design is written to GDSII format and sent to foundry for mask-making

Foundry tape-in flow inserts black box IP like memories, repeats physical and circuit verification

What's Next

Fabricate Your Design

Fabrication services through the Efabless platform

- Samples starting at \$26,000 for an X-FAB 180nm process node
- Packaging and PCB board options are available
- Initial volumes support
- Transition path to full-service provider for long-term support

Flexible Development Models

Choose between multiple options for development:

- **Full Turn-Key** -- full-service model
- **Design Assisted** -- physical implementation and layout
- **Roll-Your-Own** -- fabrication services only

Complete the design with Tanner EDA from Mentor

- Design on the cloud-based platform
- Bring your own license
- Upload your custom analog IP

FULL TURN-KEY

DESIGN ASSISTED

ROLL-YOUR-OWN

Roadmap

- new templates targeting application specific use-cases
- new IP providing more options for existing and new templates
- support for additional nodes and foundries
- support for additional Mentor / Tanner tools (e.g. RF)
- new design services and partners

Get Started !!

Go to Efabless.com and explore...

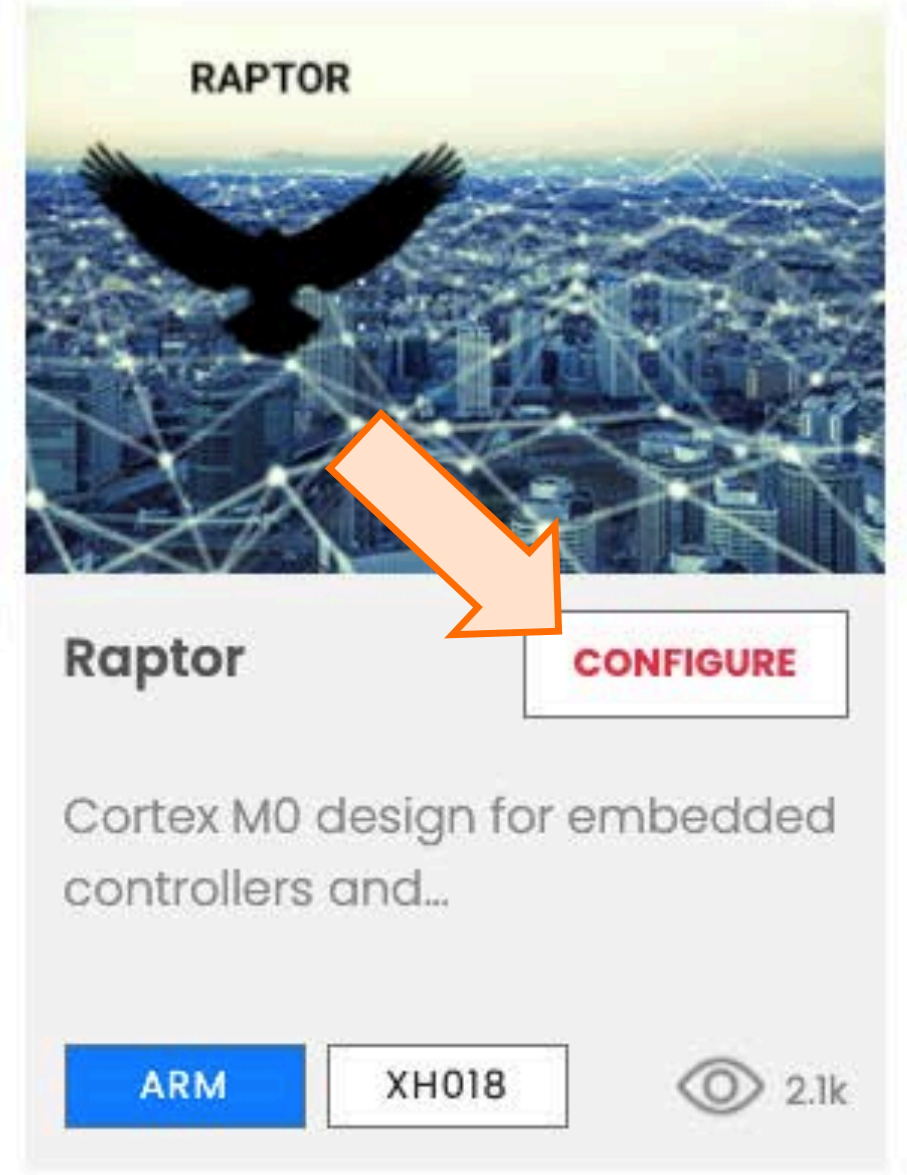

Select an SoC Template and experiment with it through the web configurator

Create a project from a saved SoC configuration and try generating the design

Contact Efabless about enabling Tanner Tools for your workspace on the platform.

Customize the design and complete the design using Mentor Tanner EDA.

Copy the SoC Templates to your own workspace on the platform and create new versions

Thank You!
